Examiner

Ron Schwadron, Ph.D.

rt Unit 1**644**

	Ron Schwadron, Fil.D.					
The MAILING DATE of this communication appears	on the cover sheet with the corres	pondence address				
Period for Reply						
A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE MONTH(S) FROM THE MAILING DATE OF THIS COMMUNICATION. - Extensions of time may be available under the provisions of 37 CFR 1.136 (a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the						
mailing date of this communication. If the period for reply specified above is less than thirty (30) days, a reply within the If NO period for reply is specified above, the maximum statutory period will apply. Failure to reply within the set or extended period for reply will, by statute, cause the Amy reply received by the Office later than three months after the mailing date of earned patent term adjustment. See 37 CFR 1.704(b).	and will expire SIX (6) MONTHS from the maili he application to become ABANDONED (35 U.S	G.C. § 133).				
Status						
1) Responsive to communication(s) filed on		·

1. Applicant's election with traverse of the species DNA encoding 55 kD TNFBP and DNA encoding IgG3 in Paper No. 24 is acknowledged. The traversal is on the ground(s) that are stated in said paper. This is not found persuasive because of the following reasons.

Regarding applicants comments, the elected species (and generic claim) are rejected over the prior art for the reasons elaborated in the instant Office Action. Regarding applicants comments about how long the instant application was pending, claims reading on the second species (eg. DNA encoding 75 kD receptor fusion protein) were not even present in the instant application until the amendment filed 8/31/2000. The requirement is still deemed proper and is therefore made FINAL.

- 2. Claims 71,74-78,81,87,90-94,97 are withdrawn from further consideration pursuant to 37 CFR 1.142(b), as being drawn to a nonelected, there being no allowable generic or linking claim. Applicant timely traversed the restriction (election) requirement in Paper No. 24.
- 3. Claims 66-70,72,73,79,80,82-86,88,89,95,96,98,90 are under consideration.
- 4. The following is a quotation of the first paragraph of 35 U.S.C. 112:

The specification shall contain a written description of the invention, and of the manner and process of making and using it, in such full, clear, concise, and exact terms as to enable any person skilled in the art to which it pertains, or with which it is most nearly connected, to make and use the same and shall set forth the best mode contemplated by the inventor of carrying out his in

5. Claims 66-70,72,73,79,80,82-86,88,89,95,96,98,90 are rejected under 35 U.S.C. 112, first paragraph, as containing subject matter which was not described in the specification in such a way as to reasonably convey to one skilled in the relevant art that the inventor(s), at the time the application was filed, had possession of the claimed invention.

The specification does not provide adequate written description of the claimed invention. The legal standard for sufficiency of a patent's (or a specification's) written description is whether that description "reasonably conveys to the artisan that the inventor

had possession at that time of the. . .claimed subject matter", Vas-Cath, Inc. V. Mahurkar, 19 U.S.P.Q.2d 1111 (Fed. Cir. 1991). In the instant case, the specification does not convey to the artisan that the applicant had possession at the time of invention of the claimed inventions.

Claims 66 and 67 encompass nucleic acids encoding any extracellular domain of a TNF receptor from any species. There are over four thousand species of mammal. The only nucleic acids encoding a sequence comprising an extracellular domain of a TNF receptor disclosed in the specification are those disclosed in Figures 1 and 4 for two different forms of human TNF receptor. Regarding the other claims, the only nucleic acids encoding a sequence comprising an extracellular domains/soluble fragment of an insoluble TNF receptor disclosed in the specification are those disclosed in Figures 1 and 4. Claims 68,72,73,84 would encompass nucleic acids encoding soluble portions of insoluble TNF binding proteins irregardless of the molecular weight of said receptors. The only nucleic acids encoding a sequence comprising a soluble portions of insoluble TNF binding proteins of a TNF receptor disclosed in the specification are those disclosed in Figures 1 and 4, wherein the sequences encode a 55kD or 75Kd receptor. Regarding claims that specify the 55kD receptor, said claims would encompass alleles, variants and mutants of said 55kD receptor, wherein the only nucleic acid encoding a 55kD TNF receptor is that disclosed in Figure 1. Thus, the written description provided in the specification is not commensurate with the scope of the claimed inventions. In view of the aforementioned problems regarding description of the claimed invention, the specification does not provide an adequate written description of the invention claimed herein. See The Regents of the University of California v. Eli Lilly and Company, 43 USPQ2d 1398, 1404-7 (Fed. Cir. 1997). In University of California v. Eli Lilly and Co., 39 U.S.P.Q.2d 1225 (Fed. Cir. 1995) the inventors claimed a genus of DNA species encoding insulin in different vertebrates or mammals, but had only described a single species of cDNA which encoded rat insulin. The court held that only the nucleic acids species described in the specification (i.e. nucleic acids encoding rat insulin) met the description requirement and that the inventors were not entitled to a claim encompassing a genus of nucleic acids encoding insulin from other vertebrates, mammals or humans, id. at 1240. In the instant case, the specification has disclosed a single nucleic acid encoding a 55kD TNF receptor with the nucleic acid sequence disclosed in Figure 1. The Federal Circuit has held that if an inventor is "unable to envision the detailed constitution of a gene so as to distinguish it from other

Serial No. 08/444791 Art Unit 1644

materials. . . conception has not been achieved until reduction to practice has occurred", Amgen, Inc. v. Chugai Pharmaceutical Co, Ltd., 18 U.S.P.Q.2d 1016 (Fed. Cir. 1991). Attention is also directed to the decision of The Regents of the University of California v. Eli Lilly and Company (CAFC, July 1997) wherein is stated: The description requirement of the patent statute requires a description of an invention, not an indication of a result that one might achieve if one made that invention. See In re Wilder, 736 F.2d 1516, 222 USPQ 369, 372-373 (Fed. Cir. 1984) (affirming rejection because the specification does "little more than outlin[e] goals appellants hope the claimed invention achieves and the problems the invention will hopefully ameliorate."). Accordingly, naming a type of material generally known to exist, in the absence of knowledge as to what that material consists of, is not a description of that material.

Thus, as we have previously held, a cDNA is not defined or described by the mere name "cDNA," even if accompanied by the name of the protein that it encodes, but requires a kind of specificity usually achieved by means of the recitation of the sequence of nucleotides that make up the cDNA. See Fiers, 984 F.2d at 1171, 25 USPQ2d at 1606.

- 6. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:
 - (a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.
- 7. Claims 66-70,72,79,80,82,84-86,88,95,96,98 are rejected under 35 U.S.C. 103(a) as being unpatentable over Schall et al. in view of Capon et al. (US Patent 5428130).

Schall et al. teach the nucleic acid sequence encoding an insoluble (eg. membrane bound) TNF receptor (see Figure 1(a), wherein said sequence encodes a receptor that is about 55kD (eg. 415 amino acids, wherein the molecular weight would be 50,578, plus carbohydrate weight because the molecule is glycosylated, see page 368, first column, first complete paragraph)). Schall et al. teach the extracellular portion of said molecule (see page 362). The extracellular portion of the membrane bound molecule would be a soluble portion of said molecule. Schall et al. do not teach a nucleic acid encoding an Ig/soluble portion of a 55kD TNF receptor. Capon et al. teach DNA encoding Ig/ligand binding fusion

proteins (see column 5). Capon et al. teach that the lg/ligand binding fusion protein can contain the soluble portion of a cell surface receptor (eg. the receptor minus the transmembrane and cytoplasmic domains, see column 8, first complete paragraph). Capon et al. teach that the DNA encoding the lg portion of the fusion protein can contain at least the hinge, CH2 and CH3 domains of the constant region of an Ig heavy chain or the Fc portion of the heavy chain (see column 10, second paragraph). Capon et al. teach vectors containing said DNA (see column 26). Capon teach the use of IgG-3 constant region in said fusion proteins (see claim 3). Capon et al. teach that the ligand binding portion of the lg/ligand binding fusion protein can be derived from a wide variety of different known cell surface receptors (see column 7, third paragraph from bottom). It would have been prima facie obvious to one of ordinary skill in the art at the time the invention was made to have created the claimed invention because Schall et al. teach the nucleic acid sequence encoding an insoluble (eg. membrane bound) 55kD TNF receptor while Capon et al. teach DNA encoding soluble Ig/ligand binding fusion proteins wherein the ligand binding protein is a soluble portion derived from a cell surface receptor. One of ordinary skill in the art would have been motivated to do the aforementioned because Capon et al. teach that the ligand binding portion of the Ig/ligand binding fusion protein can be derived from a wide variety of different known cell surface receptors (see column 7, third paragraph from bottom) and that said fusion proteins have a variety of a uses (see column 4).

- 8. No claim is allowed.
- 9. Papers related to this application may be submitted to Group 1600 by facsimile transmission. The faxing of such papers must conform with the notice published in the Official Gazette, 1096 OG 30 (November 15, 1989). Papers should be faxed to Group 1600 at (703) 308-4242.
- 10. Any inquiry concerning this communication or earlier communications from the examiner should be directed to Dr. Ron Schwadron whose telephone number is (703) 308-4680. The examiner can normally be reached Monday through Thursday from 7:30 to 6:00. A message may be left on the examiners voice mail service. If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Ms. Christina Chan can be reached on (703) 308-3973. Any inquiry of a general nature or relating to the status

Serial No. 08/444791 Art Unit 1644

of this application should be directed to the Group 1600 receptionist whose telephone number is (703) 308-0196.
